## Problems with Multiple Loc-RIBs

- Multiple Loc-RIBs also mean:
  - Memory consumption and CPU usage go from  $O(P)$  to:
$$\sum_1^N (P(n) \cdot (n - 1))$$
    - ... where  $N$  = number of clients,  $P$  = number of prefixes
    - Add a little if “soft-reconfiguration inbound” used
- Quagga is single-threaded
  - multiple cores won't help you for CPU
  - but 64 bit images might for memory
  - you can now run separate daemons for IPv4 and IPv6
- All this is fine if you're a small IXP
- Not so good if you have lots of prefixes and route-server clients.

Thanks for listening!

That's all folks...

...any questions?
